

Out Of Control?

Office technology and associated running costs, collectively known as the "document output" costs, can represent the third largest overhead after people and buildings.

Yet, astonishingly, most decision makers simply don't have access to specialist market knowledge but frequently make major purchases.

Not only are large sums of money being invested in the wrong type of hardware, but money is also being lost everyday because organisations struggle to work within the limitations of their technology, rather than have the IT work for them.

Even if all seems to be operating well, the growing pace of technology, particularly advances in digital technology and the increased use of colour printing, means that equipment becomes obsolete faster than ever.

In addition to this, the exact cost of printing a page on a photocopier may be known, but the true costs of printing to office printers or fax machines remain hidden, because the real cost of consumables and service is difficult to calculate.

It's a problem that effects every company, large or small, in every industry and profession throughout the UK.

Do You:

Know how many printers, fax machines, copiers and scanners are in place across your business?

Have a variety of ad hoc technology standards in place that are difficult to support?

Know the true costs associated with acquiring, managing and maintaining these devices and their supplies?

Fully understand how your devices are being used?

Face increasing helpdesk calls and support demands to address document output problems?

Face increasing output volumes and output costs?

Lack a single point of ownership for the management of your document output?

Face new challenges and issues integrating output devices effectively and securely within your corporate network?

The total cost of document output:
